

A private money tape

The governing philosophy, visual language, navigation model, section-by-section design intent, interaction grammar, component inventory and starter tokens — enough to brief the real screens from.

01 Core design thesis

Sorted prints your money back to you. Transaction alerts arriving on the phone are parsed into lines, stamped with a category and a source, and appended to one continuous local tape — so a month is not a dashboard assembled from queries but a document you can read end to end. Totals are printed where they were assembled, with their own summation block above them, which means no figure in the app is ever computed; it is always shown being derived from lines you can touch. Corrections do not overwrite; they re-stamp, and the original stays visible as an amendment. The tape never leaves the device, and its physicality is the argument for its privacy — a receipt is a local object, and this one belongs to no one else.

P1

Nothing is asserted

Every printed total carries its summation block. If a figure cannot show the lines behind it, it does not get printed.

P2

Append, never rewrite

Corrections re-stamp and leave the original struck through. The tape records the history of its own thinking, including the app's mistakes.

P3

Doubt is printed

Unparsed messages and unsure lines appear on the tape as blank-stamp lines. Coverage gaps are visible rather than quietly excluded.

P4

Held out, not hidden

Transfers and investments print in place with struck amounts and a HELD stamp, so exclusion is something the user watches happen.

P5

One material

No cards on cards. Sections are separated by rules, whitespace and stamps — never by nested containers or elevation stacking.

P6

Texture is a whisper

The tape is implied by white, torn edges, dotted rules and monospaced figures — not by fake paper photographs, curls, sepias or drop-shadowed sheets.

P7

Local is the luxury

Privacy is expressed as a receipt, not a padlock icon. The premium feeling comes from precision and restraint, which also happens to be cheap to render.

EMOTIONAL REGISTER

Forensic calm. The reassurance of a paper trail in an app that promises nothing left to the device — precise, quiet, faintly institutional, and satisfying in the way a well-kept ledger is. Never anxious, never congratulatory, never chatty.

MUST AVOID

— Dashboard cards as the default container, and any card inside another card.

— Charts as the primary language — donuts, pie charts, and bars with no printed sum beside them.

— Skeumorphic excess: sepias paper photographs, curling corners, coffee stains, shadowed floating sheets, faux thermal fading.

— Bank and crypto signals — gradient hero panels, card carousels, tickers, green/red P&L colouring.

— Gamification: streaks, confetti, badges, budget-exceeded alarms, emoji categories.

— Any number the user cannot tap through to its transactions.

02 Visual language

One material, two lights. The tape is the only surface in the product, everything else is ink, rule or stamp printed onto it.

OVERALL AESTHETIC

A narrow printed column on a recessed desk. Monospaced figures, uppercase small-caps stamps, dotted line rules, double rules under totals, zero-radius edges. Dense but airy — the tape is 300–320dp wide inside the viewport with desk showing at the margins, which is what makes it read as an object rather than a screen.

LIGHT MODE

Same structure, real paper. A warm clay desk (#f68dcb) with a bright tape (#ffff6f) that sits slightly proud of it. Ink at #2e2a19. Light mode is allowed more chromatic stamps — the department colours can be saturated here — but it never changes the layout or the density.

TYPOGRAPHY

Two families. A monospace face (Roboto Mono, or JetBrains Mono) for every figure, stamp, code and metadata line — this is the printed voice. A neutral UI sans (Inter) for only explanatory prose, the AI brief, and form labels. Never mono for paragraphs; never sans for numbers.

SPACING AND DENSITY

A 4dp base with an 18dp tape gutter. Transaction lines are 56dp tall — dense enough to fit eight on screen, tall enough to stay tappable. Vertical rhythm comes from dotted rules every line, so density never becomes a wall.

BORDERS AND DIVIDERS

Three rules, each with a job. Dotted 1dp between lines. Solid headline for day dividers, with the day's subtotal set in the rule itself. A double rule above every printed total — the only place two lines ever stack. No shadows on the tape; elevation is the desk going darker.

STAMPS

A 1dp outlined box, 8dp uppercase mono at 0.12em tracking, 2dp radius. Category stamps are outlined in the department hue; source stamps in ink at 40%; a query stamp is a single terracotta "P" in the same box; held-out lines take a filled sage stamp. Filled stamps are rare on purpose — they mean the app is certain.

TEXTURE DISCIPLINE

Four permitted cues only: the tape's fixed narrow width, a zigzag torn edge at each end, dotted rules, and a barely-there fibre noise at under 3% opacity. Everything else — photographic paper, curls, shadows, ageing, print misalignment — is forbidden. The metaphor lives in the layout logic, not in the pixels.

DARK MODE

The default. A near-black desk (#0a0a0c) with a warm near-black tape (#17150f) sitting on it, lit only by an inset hairline. Ink is warm off-white (#e7dccc) — never pure white, because ink is pigment. Amber is the only accent, used for the active total and the primary stamp.

COLOUR PALETTE

Two grounds, one ink, four stamp rules. Amber for spend and anything current, terracotta for query and amendment, a muted sage for credits (refunds, rewards, income), and cool grey-green for held-out money. Departments get hue-only variation within the stamp outline, never a filled swatch.

NUMBER STYLING

Tabular monospace, right-aligned to a single column that runs the full height of the tape. Rupee symbol only on totals and printed blocks, omitted on line items so decimals stay aligned. Held-out amounts are struck through; negatives and adjustments print in parentheses, till-roll style.

SURFACE METAPHOR

Exactly two materials: desk (recessed, never interactive) and tape (the only surface that holds content, never the rule itself; slide up — Capture, Why this number, a merchant detail — are lengths of the same tape, torn at the top edge, not modal cards).

ICONS AND MARKS

Almost none. Phosphor at 18–18dp, thin weight, restricted to directional, search and form affordances. Content never uses an icon where a stamp could do the job — a source is the letterform SMS, not an envelope glyph.

CONFIDENCE

Confidence is not a number or a progress bar. It is the stamp's state: filled means learned or confirmed by you, outlined means inferred, empty box means the app has no opinion and needs you. Three states, legible at a glance, no percentages on screen.

03 Navigation model

Bottom navigation, but named and drawn as a tape index rather than an app switcher. Five destinations is the maximum and Settings does not get one.

THE DECISION

Four bottom tabs — Tape, Index, Add, Stamps — with Settings reached from a single header control. A rail is wrong on a phone, a drawer hides the one-handed reach, and a pure scroll index would leave Capture unreachable while reading. Four tabs keep every primary destination inside thumb range on a 6.7" device.

BAR TREATMENT

56dp, desk-coloured vinyl, a headline top rule, no elevation. Icon-plus-label, label always visible. The active tab is marked by a 2dp amber rule above it — like a tab marker on a file — not by a filled pill.

SETTINGS PLACEMENT

A single header control on Tape only, top-right, drawn as a small gear in ink at 55%. Settings is infrequent and belongs to the device rather than the money, so it sits outside the tape's own navigation.

BACK AND DEPTH

Maximum depth of two from any tab. Sheets dismiss by swipe-down; detail views push and return to the exact scroll offset and the exact line the user tapped, which is what makes "tap a number, see the lines, come back" feel free.

GUARDRAIL

No tab badges except one: an amber count on Tape when there are unstamped lines. Badging Index or Stamps would turn the tape into a notification surface.

NAVING

Use the metaphor's nouns in the UI: Home is Tape, Insights is Index, Capture is Add, Rules is Stamp. Settings stays Settings. The vocabulary is what stops the product drifting back into dashboard language six sprints from now.

ADD

Centre-right tab, not a floating action button. An FAB would hover above the tape and break the one-material rule; the Add tab opens a torn sheet that visibly slots a new line into the tape.

ONE-HANDED RULES

Every destructive or committing action sits in the bottom third; every explanatory action can be reached by tapping content. The month selector is in the header but is also reachable by a long swipe at the tape edge, so the top of the screen is never required.

MONTHLY TOTAL

The largest type in the product: 34dp mono, tabular, tight. Above it the kicker MONTH TO DATE · SPEND; below it a double rule, then the three-line summation — lines included, lines held out in parentheses, lines unstamped. The summation is always visible, not behind a tap. That is the north star, printed.

TRANSACTION LINE

Two rows in 56dp. Row one: merchant in ink at 12dp mono uppercase, amount right-aligned. Row two: category stamp, source stamp, then account and time in ink at 40%. No avatars, no leading icons, no chevrons — the whole line is the tap target.

INCLUDED VS HELD OUT

Held-out lines stay in chronological place, with the amount struck through, the merchant at 55% ink, and a filled sage HELD stamp naming the reason (MOVED, INVESTED). They are part of the reading experience because their absence from the total is the thing most worth explaining.

UNCERTAINTY LINES

An empty stamp box and a terracotta query mark, with the reason printed in plain words on row two: "merchant not read", "spend or transfer?", "small only, high value". They cannot be scrolled past without being noticeable, but they never block, alarm or modal. The header count is the only aggregate pressure.

SOURCE METADATA

Printed as receipt metadata at the end of row two — source stamp, then account tail and time. Unparsed messages print as a faded half-line saying what could not be read, which is how coverage becomes visible instead of being a settings list.

EMPTY STATE

A short length of tape with a torn top and bottom edge and one printed line: NO LINES YET. Under it, the reason and the single action — grant SMS access, or add a line by hand. The empty tape must look like the real thing at rest, not an illustration.

HEAVY DATA

Tape stays virtualised at the line level, with day rules as sticky section headers. A right-edge scrubber shows month boundaries and lets the user throw the roll; long ranges expand quiet days into a single "12 lines · 318.00" rule that expands in place. Search replaces scrolling past three months.

THE ONE THING HOME MUST GET RIGHT

The summation block under the total, visible without a tap. Everything else on this screen can be iterated; that block is the product's promise rendered in three lines.

05 Insights — the index

The tape, indexed. Insights answers aggregate questions without becoming a chart gallery: every block is a printed index entry whose figures open the underlying lines.

STRUCTURE

A single scroll of index blocks on the same tape width, each separated by a double rule and a printed heading (MERCHANT INDEX, DEPARTMENT INDEX, RECURRING, REFUND SIGNALS, SOURCE HEALTH). Blocks are sections of one roll, not cards — no gaps, no radii, no shadows between them.

MERCHANT INDEX

A printed ranked list: merchant, visit count, total, share. Right-aligned figures in a column, a dotted leader between name and figure like a table of contents. Tapping a row opens as SMS — every line across all months, with its rule and subtotal.

DEPARTMENT INDEX

The same list form, plus one permitted graphic: a printed share rule — a single-line horizontal rule segmented by department, with each segment's width being its share and its label printed underneath. It reads as a printed scale bar, not a chart, and tapping a segment opens its lines.

RECURRING

A month grid printed as a calendar strip of day numbers, with a mark on days a subscription bills and the amount printed beside each. Answers "what hits and when" spatially, in a time a fill roll could plausibly print. Missed or changed amounts are flagged with an amendment mark.

REFUND SIGNALS

Paired lines: the original spend line printed above, the candidate credit line below, joined by a bracket in the left margin, with the printed note "possible refund — not subtracted". Explicitly a signal, never an automatic netting, until matching is real.

SOURCE HEALTH

A receipt footer for the data itself: messages read, lines extracted, lines unparsed, last sync, per source. Unparsed content is a link to the actual raw messages, because the honest version of coverage is showing what was missed.

MONTH STORY

The only place prose is allowed to lead. A short brief set in the UI sans, inside a boxed region marked NOTE — visibly the first line rather than the tape printing — with every figure in T underlined and tappable. Capped at about 90 words, hedged honestly where the app is unsure, and silent rather than padded when there is nothing to say.

CHARTS, TRANSFORMED

Three printed forms replace the chart set: the segmented share rule, the calendar strip, and the sparkle-as-dotted-trace printed inline at the end of an index row. No axes, no legends, no filled areas, no donuts. Anything that cannot be printed as a rule or a list does not belong in Insights.

TEST FOR ANY NEW INSIGHTS BLOCK

Could a receipt printer plausibly produce it, and does every figure in it open a list of lines? If either answer is no, it is a dashboard widget wearing a costume.

06 Capture — adding a line

Capture is not a form, it is a blank line on the tape that you fill in. The interface should make clear you are printing into the same document.

SHEET STRUCTURE

A torn-edge sheet rises over the tape and shows a single blank transaction line in edit state, in exactly the position and format it will occupy once committed. The keyboard takes the bottom half; the line being written stays visible directly above it.

ENTRY ORDER

Amount first, in a large mono field with the currency prefilled — it is the only required field. Then merchant, with autocomplete. Everything else is a stamp the app pre-fills and the user can tap to change. A line can be committed with amount alone; the app stamps it with a query mark and asks later.

MERCHANT SUGGESTIONS

A row of recent and frequent merchants as tappable name chips directly under the amount field, ordered by recency then frequency, with their learned stamps attached — choosing Swiggy brings FOOD with it, so one tap fills three lines.

STAMPS IN THE EDITOR

Category, type and source appear as the same stamp components used on the tape, in a single row, each opening a compact picker. Source defaults to MANUAL and cannot be faked as SMS — provenance is never editable, which is what keeps the tape trustworthy.

REVIEW BEFORE COMMIT

No separate confirmation screen. The line is the preview — it already looks exactly like a tape line — so the commit button reads PRINT LINE and the user is approving something they can already see. Committing with a query stamp is allowed and is labelled as such.

APPEARING ON THE TAPE

The sheet tears away and the new line slides into its chronological position, with the day subtotal and the month total re-printing in place. A brief MANUAL stamp flash is the only celebration. If the line lands in a collapsed order day, the tape scrolls to it.

FAST ADD

A long-press on the Add tab opens a one-field amount sheet with the last-used merchant and stamps pre-applied — the repeat-last-transaction case in two taps. Also the entry point for duplicating any existing line via its own action row.

WHY THIS SHAPE

Manual entry is the moment users most often abandon. Making the form literally be the output removes the translation step, and the pre-attached learned stamps mean a repeat merchant costs one tap rather than four fields.

07 Rules — saved stamps

Rules are the stamps the app has been taught to apply. The screen should read as a stamp drawer, and every rule should show the work it has done.

LIST STRUCTURE

Printed rows on the tape, grouped by rule kind under printed headings (MERCHANT STAMPS, DEPARTMENT STAMPS, TYPE STAMPS). Each row shows the trigger on the left, an arrow, the stamp it applies on the right, and its hit count in ink at 40%.

MERCHANT RULES

"Messages matching SWIGGY → merchant SWIGGY". The matched pattern is shown as the app actually holds it, monospaced, because a user who cannot see the pattern cannot trust the rule. An example matched line prints underneath, collapsed.

DEPARTMENT RULES

"SWIGGY → FOOD". Created by default whenever a user re-stamps a line, offered as a one-tap confirmation in the correction flow rather than as a separate authoring screen. Nobody will ever visit Rules to write a rule from scratch.

TYPE RULES

"IMPS to own accounts → HELD - MOVED". The highest-stakes rules, since they move money in and out of the total, so each one prints its effect: "removes 38,200.00 from August spend".

PROVENANCE AND CONFIDENCE

Every rule is stamped with where it came from: LEARNED (from your correction), BUILT-IN (sipped from heuristic), or MANUAL. Built-in rules can be disabled but not deleted; learned rules can be deleted, which prints an amendment on the affected lines rather than silently re-sorting history.

ENABLE, EDIT, DELETE

A single state control per row — a stamp that is either inked or hollow. Disabling is instant and reversible, and immediately re-prints affected totals with the amendment note. Editing opens the same editor as the correction flow. Delete asks once and states the line count it will change.

IMPACT

Each rule row shows "Applied to 14 lines - last on 16 Aug", tappable to the exact lines. A rule with zero hits is printed at 40% ink and grouped at the bottom under UNUSED, which is how the drawer stays honest.

SEARCH

A persistent header field on Tape and Index that searches merchants, amounts and raw message text. Results print as a tape with their own summation block at the top, so a search is itself an explainable total — "14 lines matching SWIGGY · 6,200.00".

MONTH SWITCHING

Horizontal swipe on the tape body advances the roll, with the tear edge and the printed total cross-fading. The month stamp in the header opens the roll of months. Swipe is dominant because it is one-handed and matches the physical model.

MOTION PRINCIPLES

Print, do not animate. Content appears by opacity and a 4dp vertical settle over 120–160ms; expansion is 200ms on a standard ease; sheets tear in at 240ms. No springs, no overshoot, no parallax, no shimmer. The only sustained motion in the product is the first-run import printing itself.

WHY SO FEW VERBS

A ledger earns trust by behaving identically everywhere. Five Home has already learned Insights, Capture and Rules.

VERBS APPLIED WITHOUT EXCEPTION MEANS A USER WHO LEARNS

10 Component inventory

Sixteen components carry the whole product. If a screen needs something not on this list, question the screen before adding the component.

Tape header

HOME · INDEX

Brand mark, month stamp, gear, and the printed total block. Collapses to a 44dp sticky strip carrying month, total and undo.

Printed total block

EVERYWHERE

Kicker, large mono figure, double rule, and the summation rows. The product's signature component — any total anywhere uses this.

Transaction line

HOME · ALL TAPES

Two row 56dp line: merchant and amount; stamps and metadata. Variants: included, held out, unstamped, manual, amended.

Day divider

HOME · MERCHANT TAPE

Solid headline with the day at left and the day's subtotal set inside the rule. Collapsible variant for quiet periods.

Stamp chip

EVERYWHERE

Outlined 8dp uppercase mono box. States: filled (learned), outlined (inferred), empty (no opinion). The universal taxonomy element.

Source mark

LINES · SETTINGS

A stamp variant in ink at 40% carrying SMS, EMAIL or MANUAL. Never editable — provenance is structural.

Confidence mark

LINES · RULES

Not a separate element: the stamp's fill state. Documented as a component so nobody ships a percentage or a progress bar.

Review query line

HOME · INDEX

An unstamped line with a terracotta query mark and the reason printed in plain words, plus inline accept and correct actions.

Amendment block

LINES · RULES

A bracketed left-margin note recording what changed, when and by whom. Collapsible, never deletable.

Index block

INSIGHTS

A printed heading, a ranked list with dotted leaders, and a summation row. The container for every Insights section.

Share rule

INSIGHTS

A single horizontal rule segmented by share, and the summation rows. The product's permitted graphic form for composition.

Calendar strip

INSIGHTS · RECURRING

A printed month of day numbers with billing marks and amounts. The one-permitted graphic form for timing.

Merchant tape

PUSHED VIEW

A filtered tape for one merchant, with its own total block, visit rhythm and learned stamp shown at the top.

Rule stamp row

RULES

Trigger, arrow, applied stamp, provenance, hit count and an inked/hollow state control. Leads to affected lines.

Capture line editor

ADD SHEET

A blank transaction line in edit state, in final format, with amount field, merchant autocomplete and stamp row.

Privacy receipt

SETTINGS

The printed total block form applied to a claim statement, double rule, and the figures that substantiate it.

Empty tape

ALL TABS

A short torn length of tape with one printed line and a single action. Same material at rest — never an illustration.

Tear sheet

ALL SHEETS

The sheet chrome: torn top edge, swipe-down dummies, tape-width content. Replaces every modal and bottom-sheet card.

11 Accessibility and practicality

The metaphor is never allowed to cost legibility, reachability or frame rate. Where the two conflict, the tape gives way.

READABILITY

Body and line text never below 13dp; monospace is used for 11dp and never below 60% ink. Metadata is never for short strings only — figures, stamps, merchant names — because long mono prose is slow to read. Respect the Android font scale up to 200%; lines refine from three rows rather than truncating, and the tape width grows with the scale.

TAP TARGETS

48dp minimum in every direction. The 56dp transaction line satisfies this whole-row. Stamps are visually 20dp but carry a 48dp hit box, with 8dp of clearance between adjacent stamps so filtering by tapping a stamp never mis-fires.

CONTRAST

Ink on tape is 4.5:1 or better in both modes at all text sizes; the 40% metadata ink is only used at 14dp against the tape; and is tested to 4.5:1, never derived by opacity alone at ship time. Stamp outlines may sit at 3:1 as chrome, but stamp text never does.

COLOUR INDEPENDENCE

No name is carried by hue alone. Held out is struck-through plus a stated stamp; unsure is an empty box plus a printed reason; credits are parenthesised. The tape is fully usable in greyscale, which also makes the printable export honest.

SCREEN READERS

A line reads as one node: "Swiggy, 412 rupees, Food, from SMS, 16 August, 8:41 pm. Double tap for the message it came from." Totals announce their summation ("52,561 rupees 8p raise, from 68 included lines, 12 held out, 3 unstamped"). Stamp exposure state as their role description: learned, inferred, needs review. Amendments are announced as a live region when totals re-print.

REDUCED MOTION

With the system preference on, printing becomes instant: no settle, no tear animation, no first-run print sequence — the import shows a progress line and a completed tape. Nothing in the product depends on motion to be understood.

LARGE VOLUMES

Virtualise at the line level with stable keys: day rules as sticky headers; quiet-period collapsing beyond the current month; search and stamp-filters as the primary navigation past three months. Target: 20,000 lines with no jank on a 2019 mid-range device.

LOW-END PERFORMANCE

No blur, no shadow on the tape, no runtime texture generation, no per-line opacity. The fibre noise is a single tiled 64px asset at low opacity, or omitted entirely below a device threshold. The dotted rules are borders, not drawn elements. Dark mode on OLED is the cheapest thing to render, which is why it is the default.

GHIMPECK DISCIPLINE

Before shipping any tape flourish, ask: does it help someone read a figure or trust a total? Torn edges and dotted rules pass because they mark boundaries. Curling corners, paper photographs and print-like animations fail. Review this list at every design review — the metaphor is the thing most likely to drift.

12 Design tokens

A starter set, named for the metaphor so the code reads like the product: desk, tape, ink, rule, stamp.
